CANTEEN ORDER MANAGEMENT SYSTEM

Problem Statement

Managing food orders manually in a canteen can be time-consuming and may lead to errors in maintaining order details. It can be difficult to keep track of order IDs, food items, and their quantities.

The **Canteen Order Management System** is a C++ program developed using a **singly linked list** to manage canteen orders efficiently. The system allows users to add new orders, display all available orders, and delete orders using their Order ID. Each order contains an Order ID, Food Item, and Quantity.

The system also prevents duplicate Order IDs and displays an appropriate message when an order is not found. This project demonstrates the use of linked lists, structures, pointers, and dynamic memory allocation in C++.
